

COOPER LIGHTING · SIGNIFY · OPERATIONAL INTELLIGENCE

A live mesh of devices, made *legible*

CORE Insights turns raw lighting and sensor telemetry into operational intelligence, one platform serving the portfolio analyst, the facilities manager, and the technician on the floor.

Meet the operators

OCCUPANCY PRO, FLOOR HEAT MAP, LIVE UTILIZATION, CAPACITY, AND TREND, ON A SINGLE SCREEN

40,000+ devices, *no way to act*

Sensors embedded in code-compliant LED luminaires streamed occupancy, energy, and environmental data around the clock. But for the facilities teams who ran these buildings, the signal stayed buried in monthly PDFs and spreadsheets.

As Experience Design Lead I owned the end-to-end UX — the dashboard, the reporting suite, the floor-map visualization, and the on-premises to cloud path — designing one operator's window into the live mesh that gives three very different users exactly the view they need.

OPERATORS	TIMELINE
Portfolio analyst Facilities manager · Technician	2022, 2023
DONAIN	PLATFORM
Connected lighting · space analytics	Web · iOS · Android

CHALLENGE

Three users, *one interface*

Three forces shaped every screen, each a constraint the system had to honor, not a feature to bolt on.

- 01

Every building a silo

No way to compare occupancy, energy, or alerts across a portfolio. Each site lived in its own report.
- 02

Three reads, one screen

PRO analysts wanted portfolio analytics. Site managers wanted floor control. Technicians wanted answers on the floor.
- 03

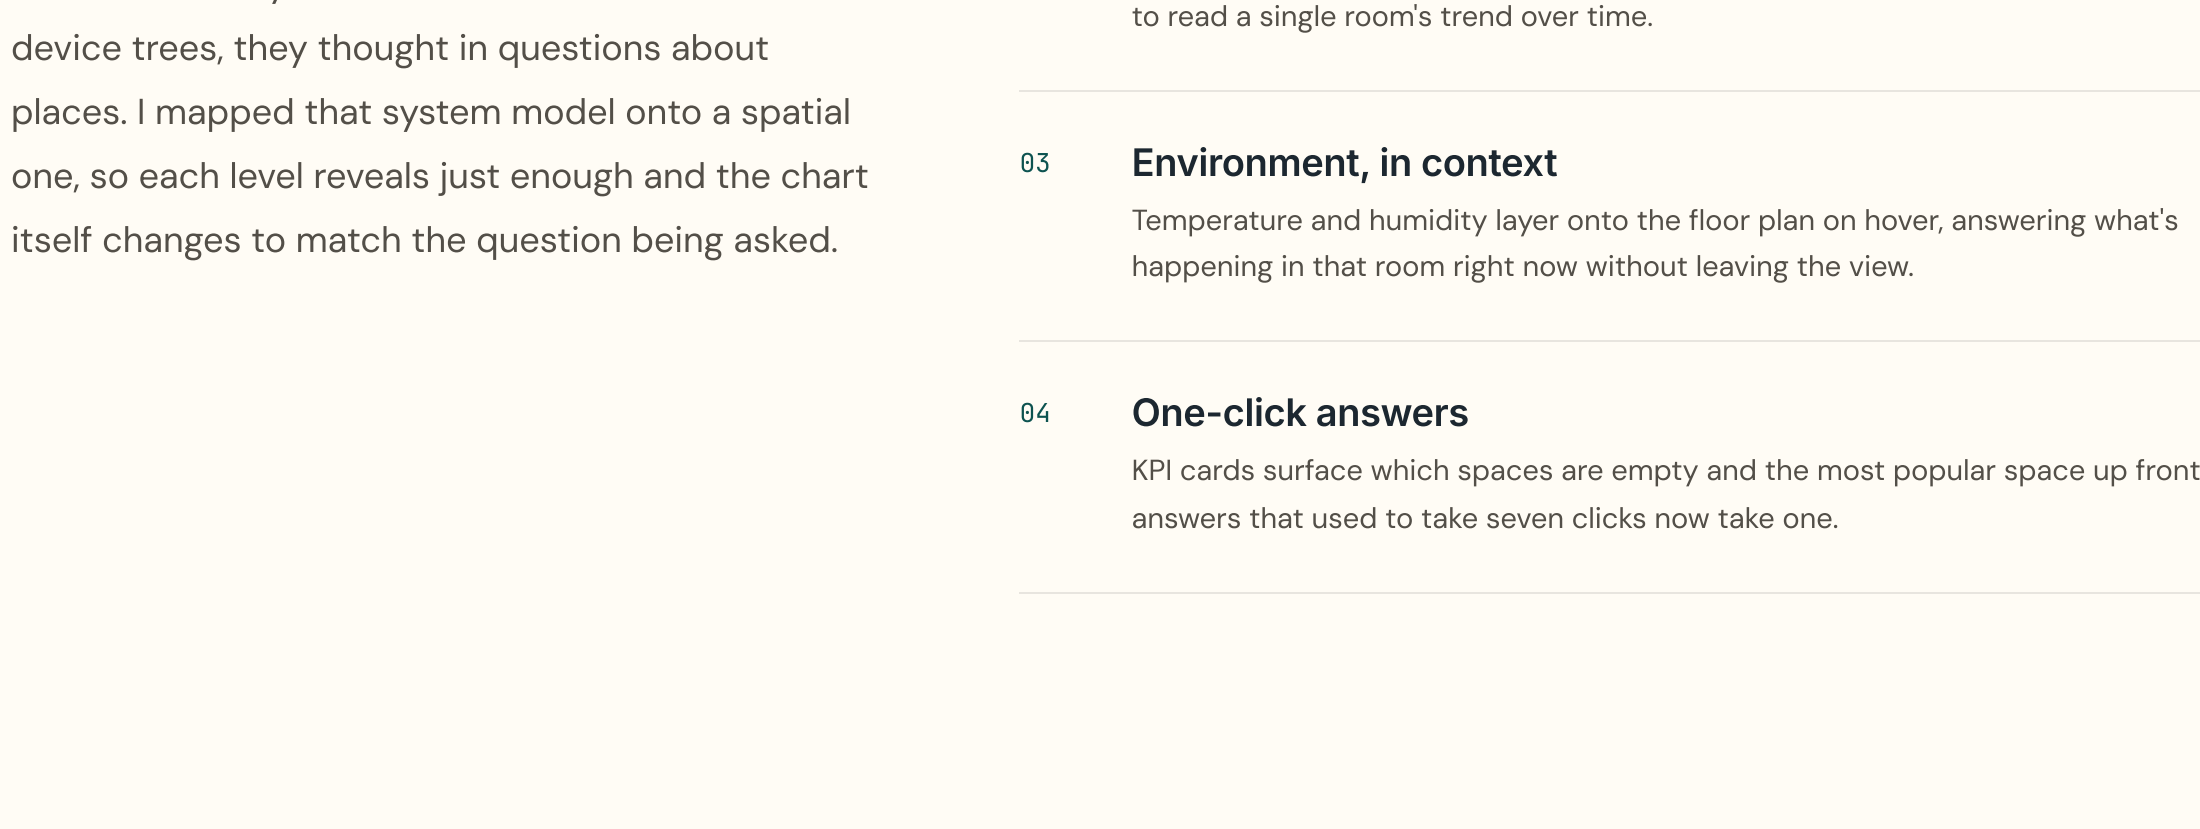

No shared taxonomy

Fixtures, zones, and spaces had no semantic model, so nothing could roll up or drill down cleanly.

THE OPERATORS

The same data, *shaped to each role*

One source of truth becomes the PRO analyst's portfolio heat map, the facilities manager's floor and room view, and the technician's at-a-glance desk availability.

APPROACH

From device tree to *places*

The platform modeled every building as a strict device hierarchy. Facilities teams didn't think in device trees, they thought in questions about places. I mapped that system model onto a spatial one, so each level reveals just enough and the chart itself changes to match the question being asked.

01 Progressive disclosure

Organization → Location → Floor → Room. Each of the five levels reveals just enough detail, keeping cognitive load manageable at the top.

02 The chart matches the question

Bar charts to compare sites, a heat map to orient in physical space, line charts to read a single room's trend over time.

03 Environment, in context

Temperature and humidity layer onto the floor plan on hover, answering what's happening in that room right now without leaving the view.

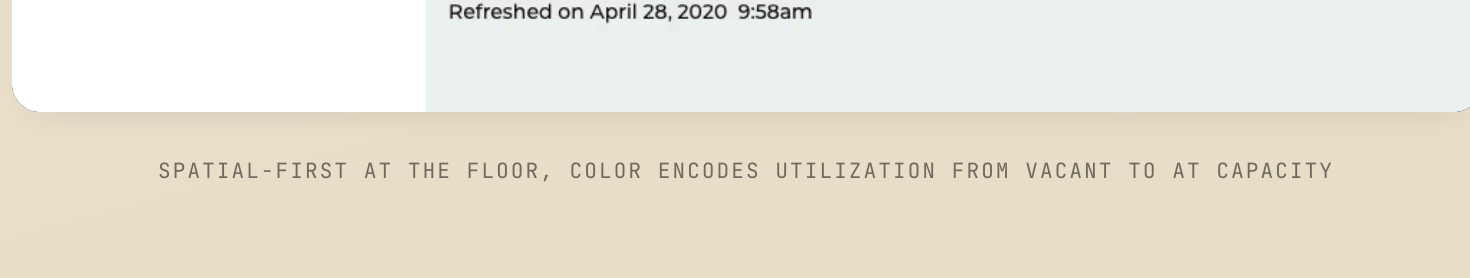

04 One-click answers

KPI cards surface which spaces are empty and the most popular space up front, answers that used to take seven clicks now take one.

THE FLOOR, LIVE

A spreadsheet becomes *a living map*

At floor level a heat map replaces the bar chart, where spatial context matters more than comparative data. Click any space to inspect live occupancy, status, capacity, and trend.

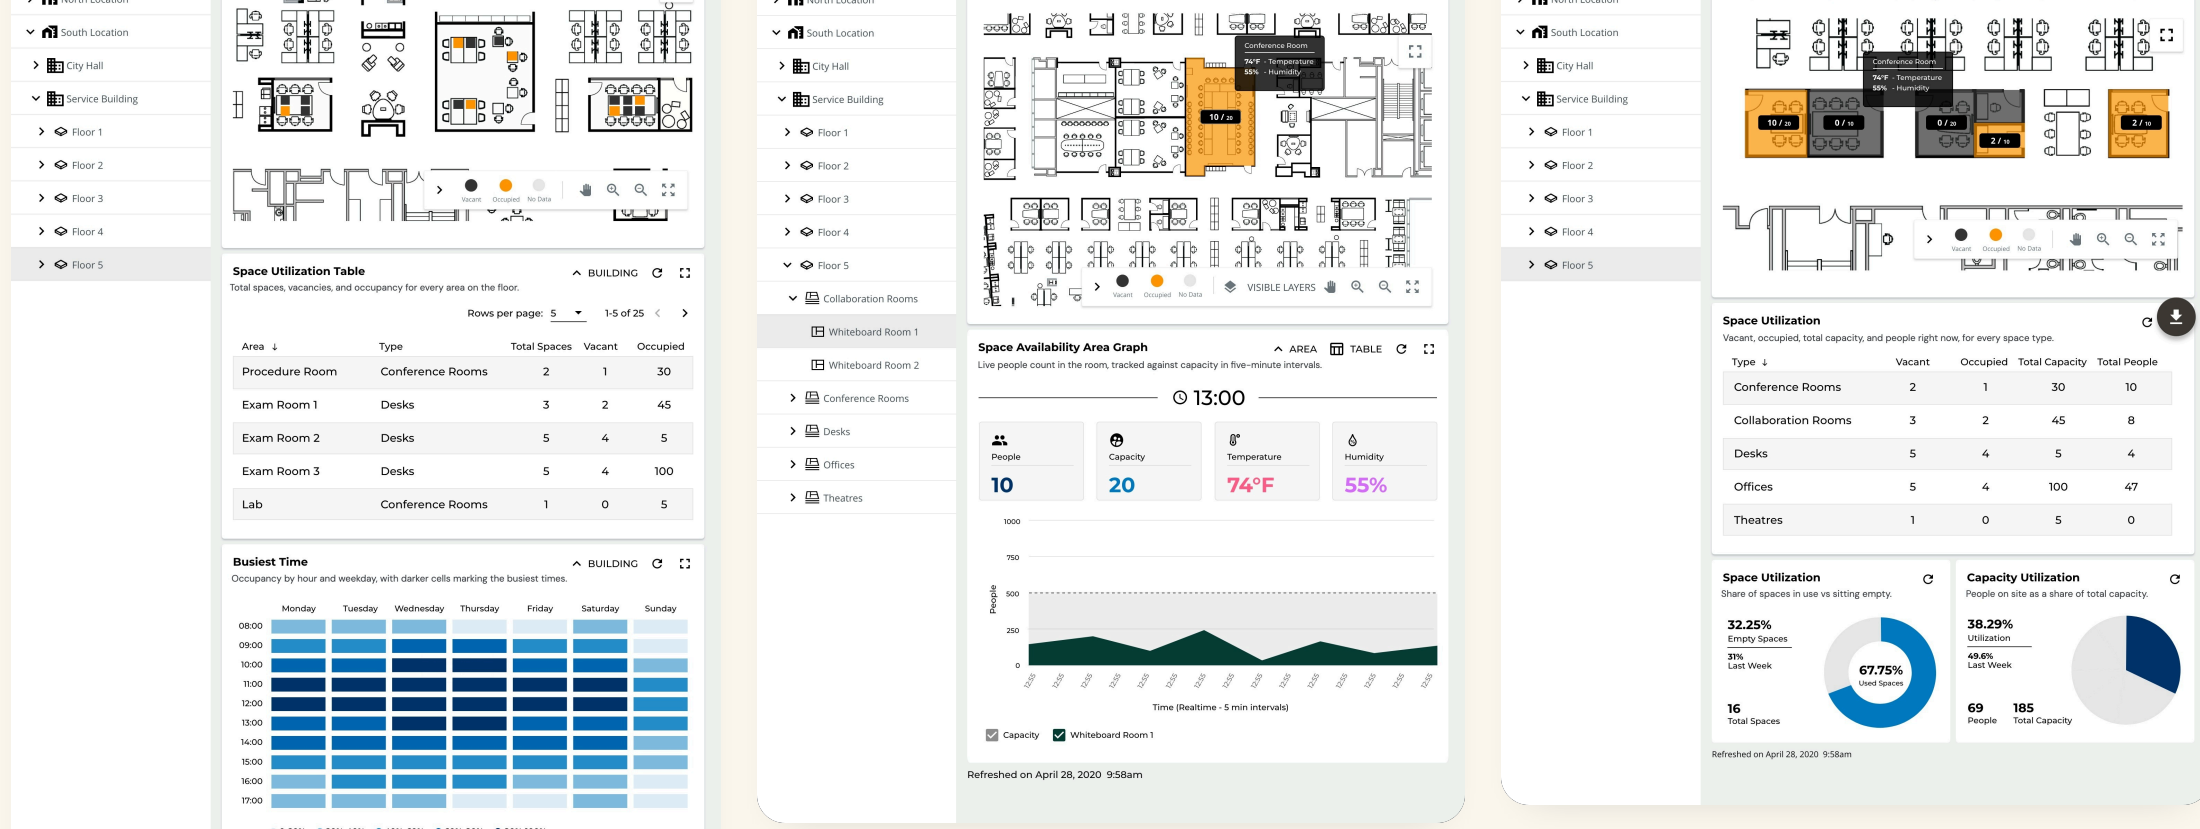

SPATIAL-FIRST AT THE FLOOR, COLOR ENCODES UTILIZATION FROM VACANT TO AT CAPACITY

OUTCOME

Built for how the *floor works*

From the hot-desking floor where an employee finds a free seat, to the conference rooms a manager ranks by utilization, to the analyst's portfolio rollup, every surface inherits the same spatial model and the same shared taxonomy.

BY THE NUMBERS

Measured in the field

- 93%

Faster report generation, 5–7 min to under 30 sec

BEFORE: 5-7 MIN
AFTER: <30 SEC
- 87%

Fewer clicks to root cause, 7–9 clicks to one

BEFORE: 7-9 CLICKS
AFTER: 1 CLICK
- 23%

Average energy reduction across deployments

BASELINE: 180
AFTER: 77
- 5

Hierarchy levels, organization down to room

“

CORE Insights changed how our facilities teams operate. They went from monthly reports to a live picture they can act on in seconds.
