

CONSUMER IOT

Pro lighting, made effortless

Professional-grade connected lighting, reframed for the consumer smart home, enterprise depth under the hood, one-tap simplicity on the surface.

See network topology

DAILY CONTROL · COLOR · TOPOLOGY, ONE APP, THREE DEPTHS

THE BRIEF

Enterprise depth, *consumer ease*

The strategic opportunity: take enterprise-grade lighting technology, mesh networks, circadian tuning, fleet management, and make it feel as simple as a single switch, to compete directly in the consumer smart-home market.

Enterprise users tolerate friction; consumers abandon it. Every flow had to hide the complexity without removing the power.

ROLE	SCOPE
Product Designer	Research & IA UI system · Prototype
PLATFORM	USERS
iOS & Android	Residents · Power users Property managers
DOMAIN	SCALE
Consumer IoT · Lighting	32 → 247 devices

CHALLENGE

Power without *complexity*

Three tensions shaped every screen, each a constraint the design had to resolve, not a trade-off to accept.

01

Consumers abandon friction

The daily essentials must be reachable in one tap; everything configuration-related stays hidden until asked for.

02

Topology is intimidating

Users don't need to understand a mesh network; they need to trust that it just works, at any size.

03

Install is a chore

Commissioning had to happen before anything is mounted, scan a device in its box, assign it, done.

THE DAILY CONTROL SCREEN

Everything you use, *one tap away*

Color, warm-white, kelvin, and presets, one picker that flexes to how you actually think about light, without a settings maze.

COLOR · WARM → COOL · PRESETS

APPROACH

Hide the wiring, *keep the power*

Every advanced capability is there for the power user, but the resident never has to see it. The interface earns trust by being calm first, deep on demand.

- 01 **One-tap daily control**
Essentials reachable instantly; configuration tucked behind an accordion that only opens when you want it.
- 02 **Invisible topology**
The mesh is shown as a friendly node map, auto-grouping devices so a 32-device condo and a 247-device estate feel the same.
- 03 **Commission before install**
NFC/QR lets users scan a device still in the box, assign it to a room, and name it, before a single fixture is mounted.
- 04 **Circadian, automatic**
Light follows the day on its own, with simple manual override when someone wants to take the wheel.

MAKING NETWORK TOPOLOGY HUMAN

How do you hand BLE mesh configuration to someone who's *never heard of BLE?*

Users don't need to understand the technology if they can read the map. Black = active repeater, white = stable relay, red = reliability problem. We proposed four models, **click through them**. P1 is rebuilt live in the frame.

- P1 · Node Map
- P2 · Clusters
- P3 · Virtual Groups
- P4 · Auto Select

P1 · NODE MAP · **DROPPED**

Live mesh, drag-to-repeater

A literal node graph, drag any device onto the Gateway to promote it to a repeater, with red nodes flagging low reliability. Powerful, but it asked homeowners to think like network engineers. The frame here is a working rebuild. Drag a flagged bulb onto the gateway, then press TEST.

USER DECISION LOAD
High, manual node selection

P1 · NODE MAP, REBUILT LIVE, DRAG A BULB ONTO THE GATEWAY

DEVICE DISTRIBUTION AT SCALE

The same logical map scales from a 32-device condo to a 247-device estate, groups, subnets, and repeaters assigned automatically. Example: **247 devices, 66 repeaters, 22 subnets created.**

ESTATE EXAMPLE · 247 DEVICES · 66 REPEATERS · 22 SUBNETS (181 DERIVED FROM THE STATED FIGURES) · ONE DOT PER SUBNET

56 Devices

5 Groups or Subnets are created
1 Group or Subnet has 4 devices and 2 Repeater
1 Group or Subnet has 30 devices and 5 Repeater
1 Group or Subnet has 10 devices and 2 Repeater
1 Group or Subnet has 6 devices and 2 Repeater

105 Devices

7 Groups or Subnets are created
1 Group or Subnet has 10 devices and 3 Repeater
1 Group or Subnet has 30 devices and 5 Repeater
1 Group or Subnet has 5 devices and 2 Repeater
1 Group or Subnet has 20 devices and 4 Repeater

54 Devices

6 Groups or Subnets are created
1 Group or Subnet has 10 devices and 3 Repeater
1 Group or Subnet has 10 devices and 3 Repeater
1 Group or Subnet has 10 devices and 3 Repeater
1 Group or Subnet has 10 devices and 3 Repeater

32 Devices

4 Groups or Subnets are created
1 Group or Subnet has 10 devices and 3 Repeater
1 Group or Subnet has 10 devices and 3 Repeater
1 Group or Subnet has 2 devices and 2 Repeater

AUTO-GROUPING ACROSS REAL FLOOR PLANS

OUTCOME

A mesh you never *have to think about*

The same logical map scales from condo to estate, light follows a natural circadian rhythm, and property managers run many homes from one place, all without surfacing the underlying network.

AUTO-GROUPED MESH

CIRCADIAN, AUTOMATIC

PHASES THROUGH THE DAY

BY THE NUMBERS

Scope of the system

247
Devices at estate scale, one map

TO ONE SCALE · SAME MAP AT BOTH SIZES

1-tap
To everything you use daily

3
User tiers, resident, power user, manager

24h
Circadian rhythm, fully automatic

SELF-DIRECTED CONCEPT, NOT VALIDATED PRODUCT METRICS.

“

Users don't need to understand the mesh, they need to trust that it works. The product's job is to make the complexity disappear.
